Investment Highlights

Phase III Update on the COMFORT Trial: The COMFORT Phase III study met its primary endpoint of superiority vs. placebo at 16 weeks, $p=0.037$. Patients treated with Piclidenoson showed an improving progressive response over time, and as psoriasis is a chronic disease that may require long-term treatment, this is an important finding. Piclidenoson demonstrated an excellent safety profile, overlapping that of the placebo-treated group. Piclidenoson had a significantly better tolerability profile than Otezla, as GI-related adverse events were 1% for Piclidenoson vs. 6% for Otezla, nervous system disorders were 0.7% for Piclidenoson, 9.9% for Otezla and 3.3% for the placebo. The discontinuation rate was significantly higher for Otezla vs. Piclidenoson. In the secondary endpoint of achieving a PASI 75 response (representing a 75% reduction in psoriasis severity) at week 32, in the whole patient population, Piclidenoson was inferior to Otezla; however, in a sub-group analysis of patients who had PASI>25 (more severe psoriasis) at baseline, Piclidenoson had a comparable response to Otezla. In the secondary endpoint of achieving psoriasis disability index (PDI) response at week 32, Piclidenoson was comparable to Otezla.

Namodenoson Approved for Compassionate Use in Romania: In August, Can-Fite announced Romania became the second country, following Israel, to approve Namodenoson for compassionate use in patients with advanced liver cancer. Namodenoson induced a complete response with the disappearance of all metastases in a Romanian patient who was enrolled in Can-Fite's prior Phase IIb liver cancer study, and the patient will now continue treatment under the compassionate use program. Can-Fite's pivotal Phase III liver cancer study for Namodenoson is open for enrollment of approximately 450 patients diagnosed with hepatocellular carcinoma (HCC) and underlying Child-Pugh B7 (CPB7) who have not responded to other approved therapies.

Valuation. We evaluate Piclidenoson in Psoriasis, Namodenoson in HCC, and NAFLD. We apply a probability of success factor in these patient-based models. These metrics then flow into our valuation models. For Can-Fite, we use a 30% discount rate (in addition to the risk rate), as Can-Fite is not yet profitable, and most of the products are still dependent on the outcome of the clinical trials. Our valuation conclusion is an equally-weighted average of our FCFF, EPS, and sum-of-the-parts analysis. We use a projected fully diluted end-year share count and assume multiple raises. The conclusion of this method is a \$5.00 price target.

Risks to our thesis include the following: (1) commercial; (2) regulatory; (3) clinical; (4) manufacturing; (5) financial; (6) liability; and (7) intellectual property.

Risk Analysis

In addition to the typical risks associated with development stage specialty pharmaceutical companies, potential risks specific to Can-Fite are as follows:

Financial risk. The Company may need to raise capital in the marketplace, and there can be no assurances that the Company will be able to successfully raise capital and/or do so on favorable terms.

Clinical and regulatory risk. Lead products must start and complete clinical trials. Trials may not produce results sufficient for regulatory approval.

Partnership risk. Can-Fite may seek partnerships for clinical development support and commercialization. We have no specific knowledge of any discussions with possible partners today, and there can be no assurances that the Company will be able to secure a favorable partnership.

Commercial risk. There are no assurances that the Company will be able to secure favorable pricing, commercially launch products, and achieve significant market share to become profitable.

Legal and intellectual property risk. The Company may have to defend its patents and technical know-how, and there can be no assurances that the patents will not be infringed or will be held as valid if challenged, and or that the Company may infringe on third parties' patents.
